## Introduction

Information is inherently **transient** and subject to **periodic or non-periodic updates**. We present a QA dataset on temporally evolving information in tables.

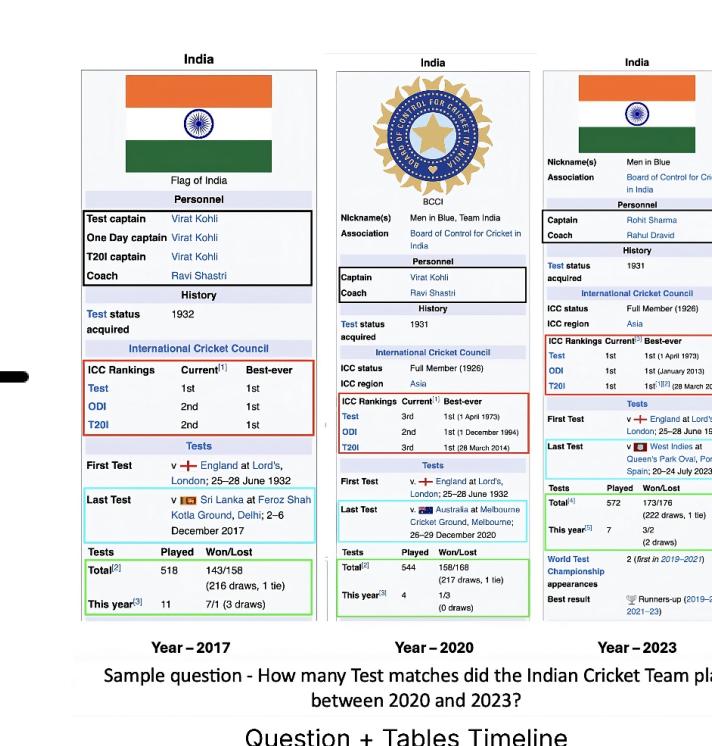

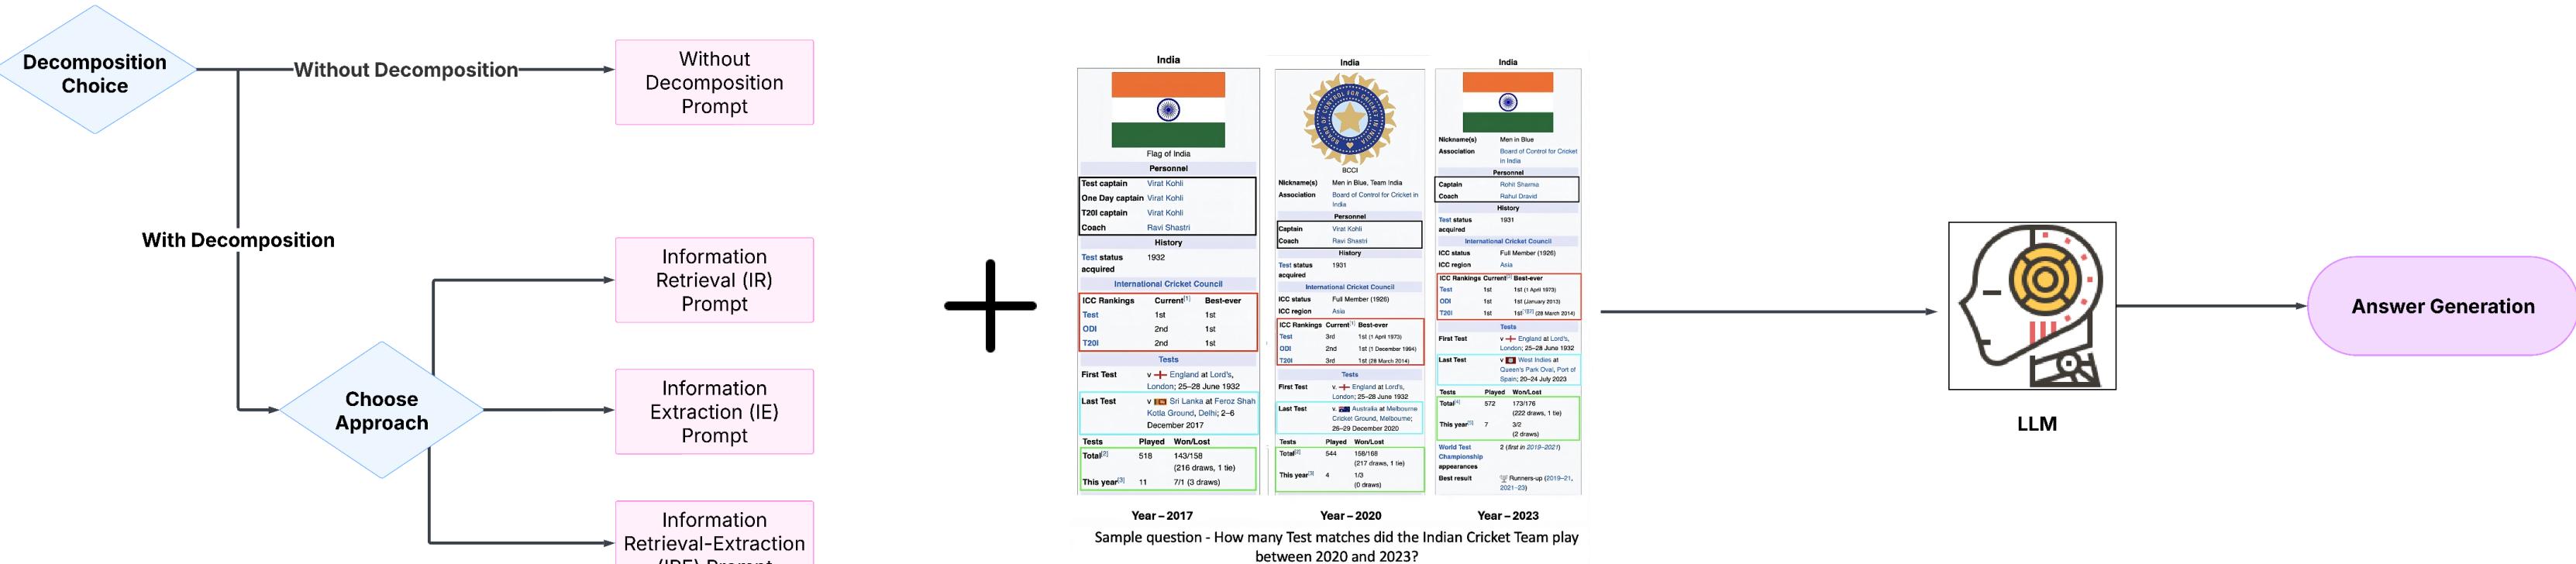

Sample question - How many Test matches did the Indian Cricket Team play between 2020 and 2023?

## Dataset Creation

TRANSIENTTABLES contains **3,971 QA pairs** derived from over **14,000 tables**, spanning **1,238 entities** across multiple time periods.

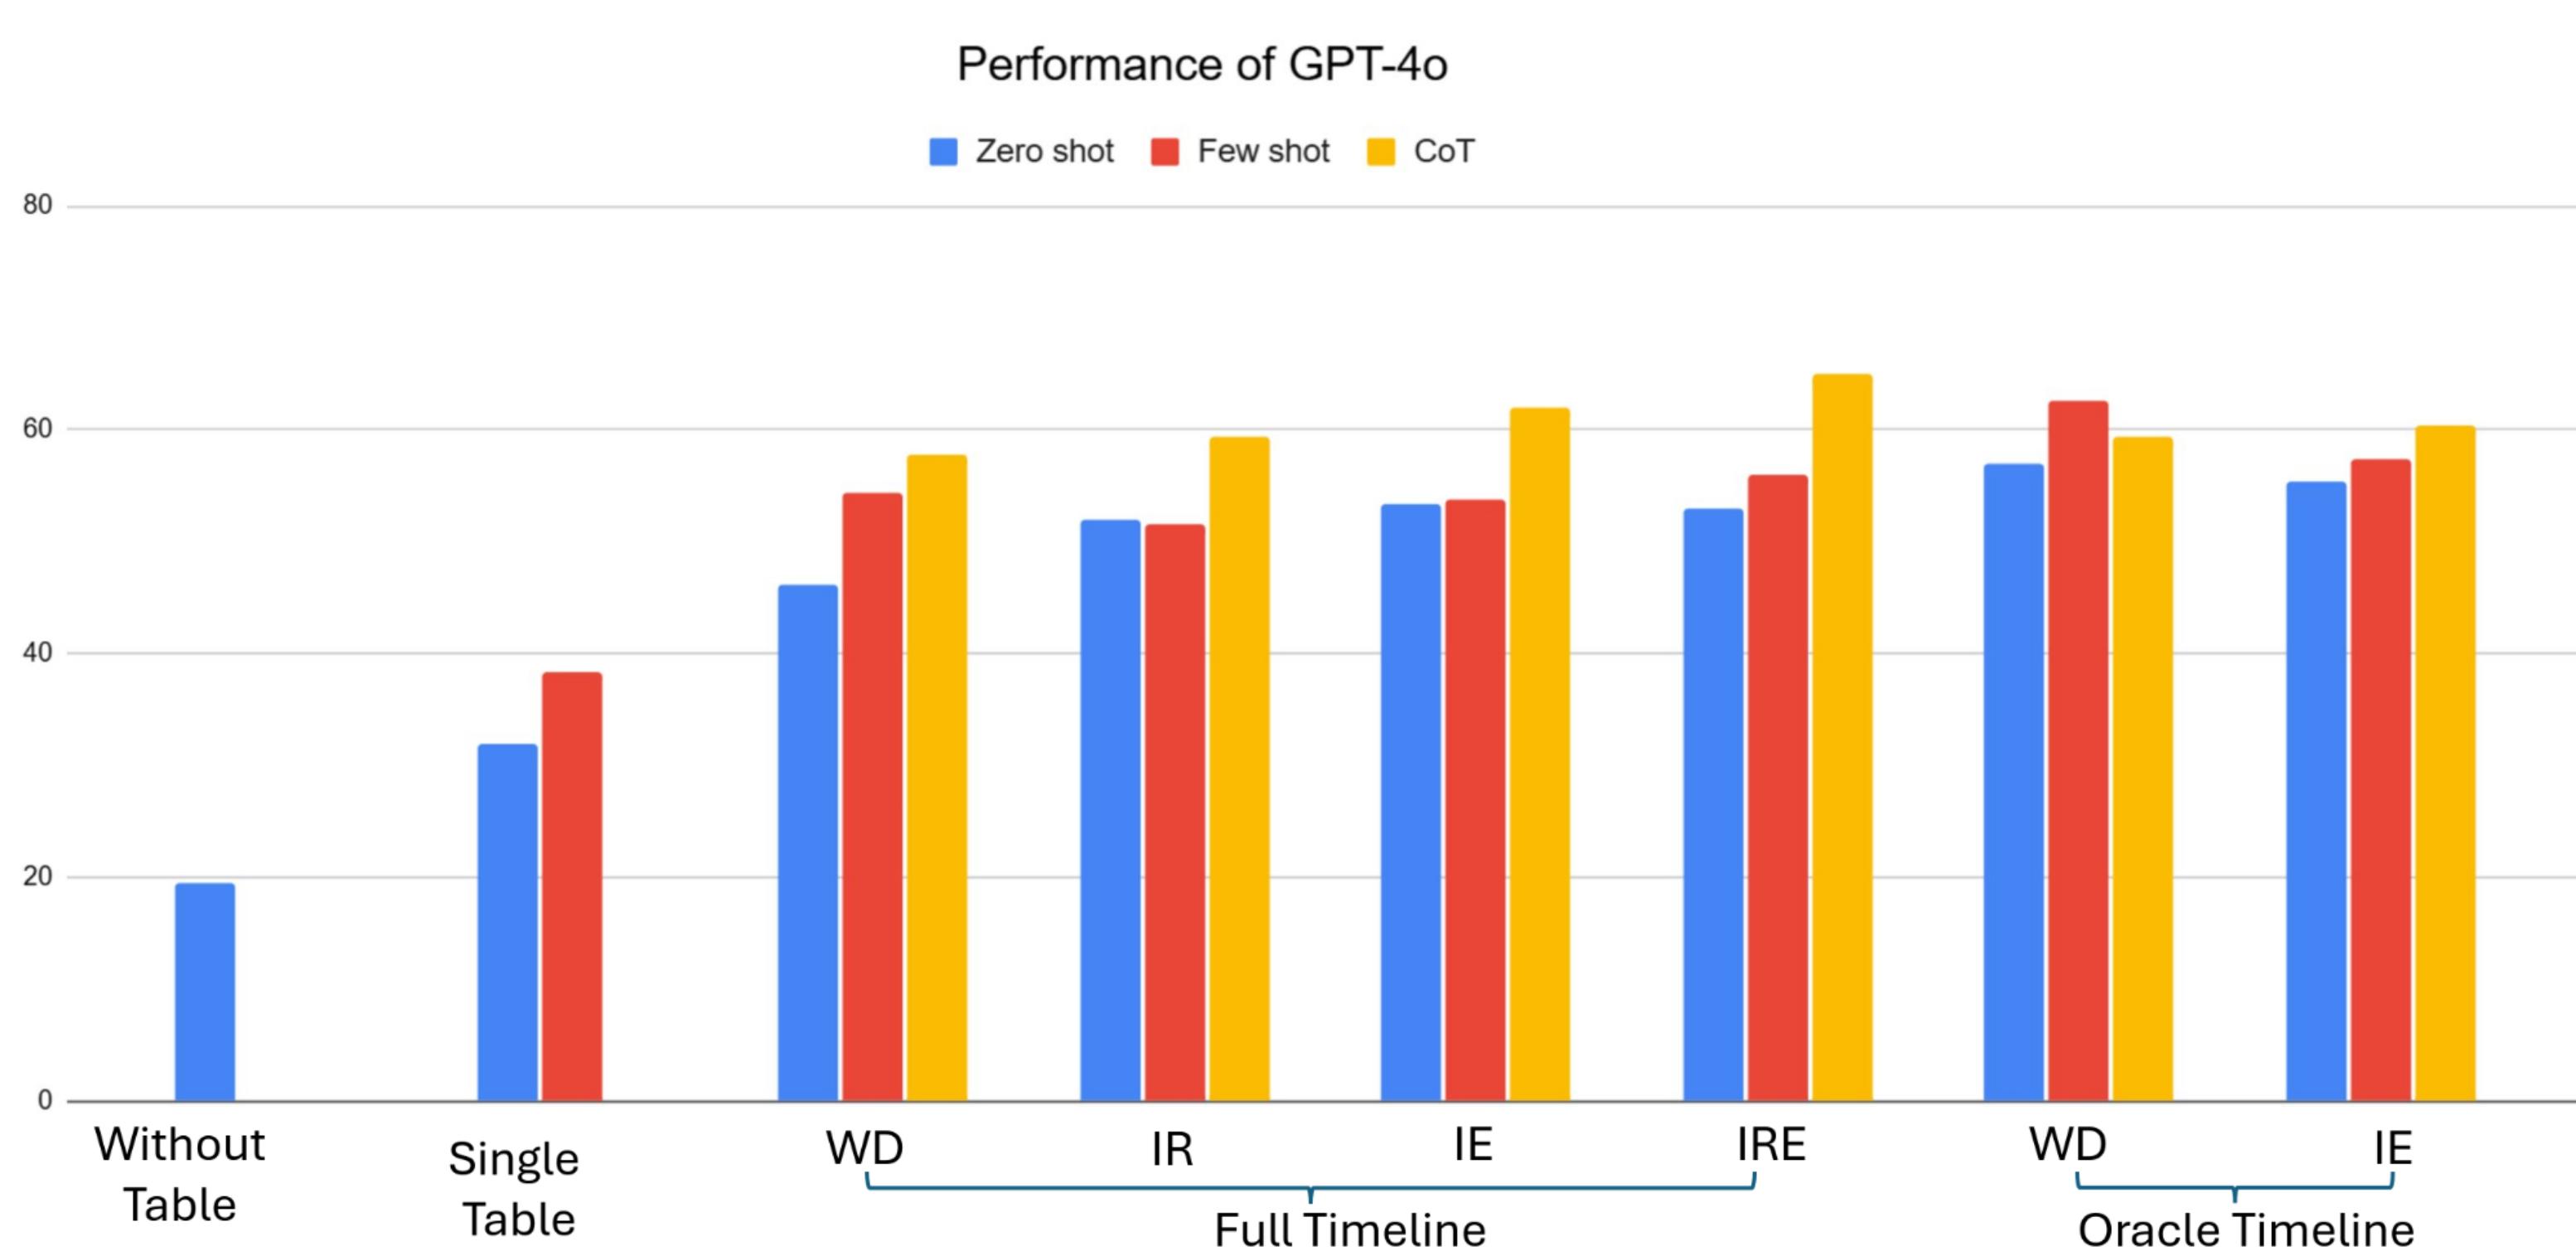

## Modelling Techniques

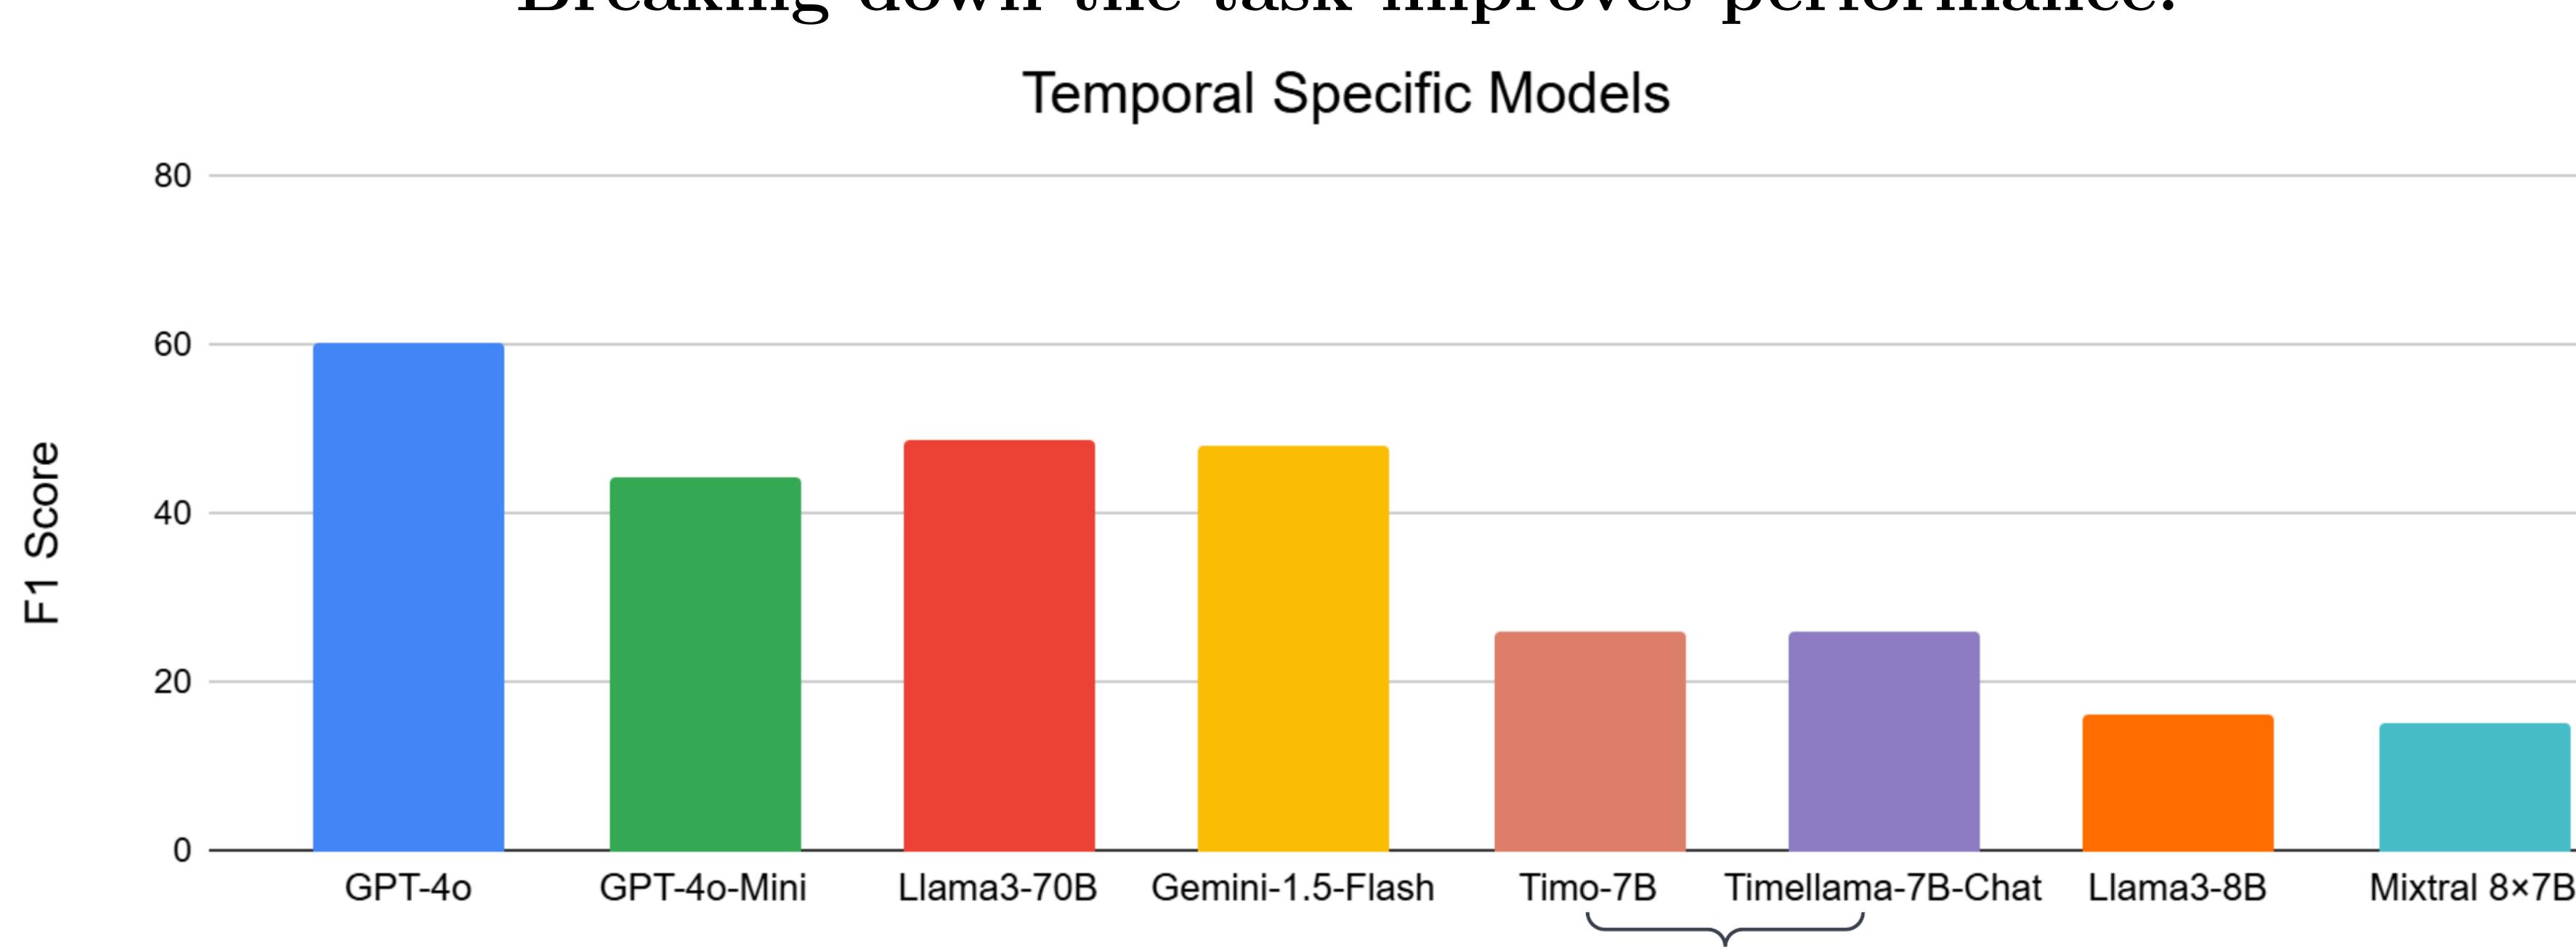

### Task Decomposition Approaches:

- Without Decomposition (**WD**): Direct answer generation
- Information Retrieval (**IR**): Table retrieval + Answer generation
- Information Extraction (**IE**): Key extraction + Answer generation
- Information Retrieval-Extraction (**IRE**): Table retrieval + Key extraction + Answer generation

## Key Results

Breaking down the task improves performance.

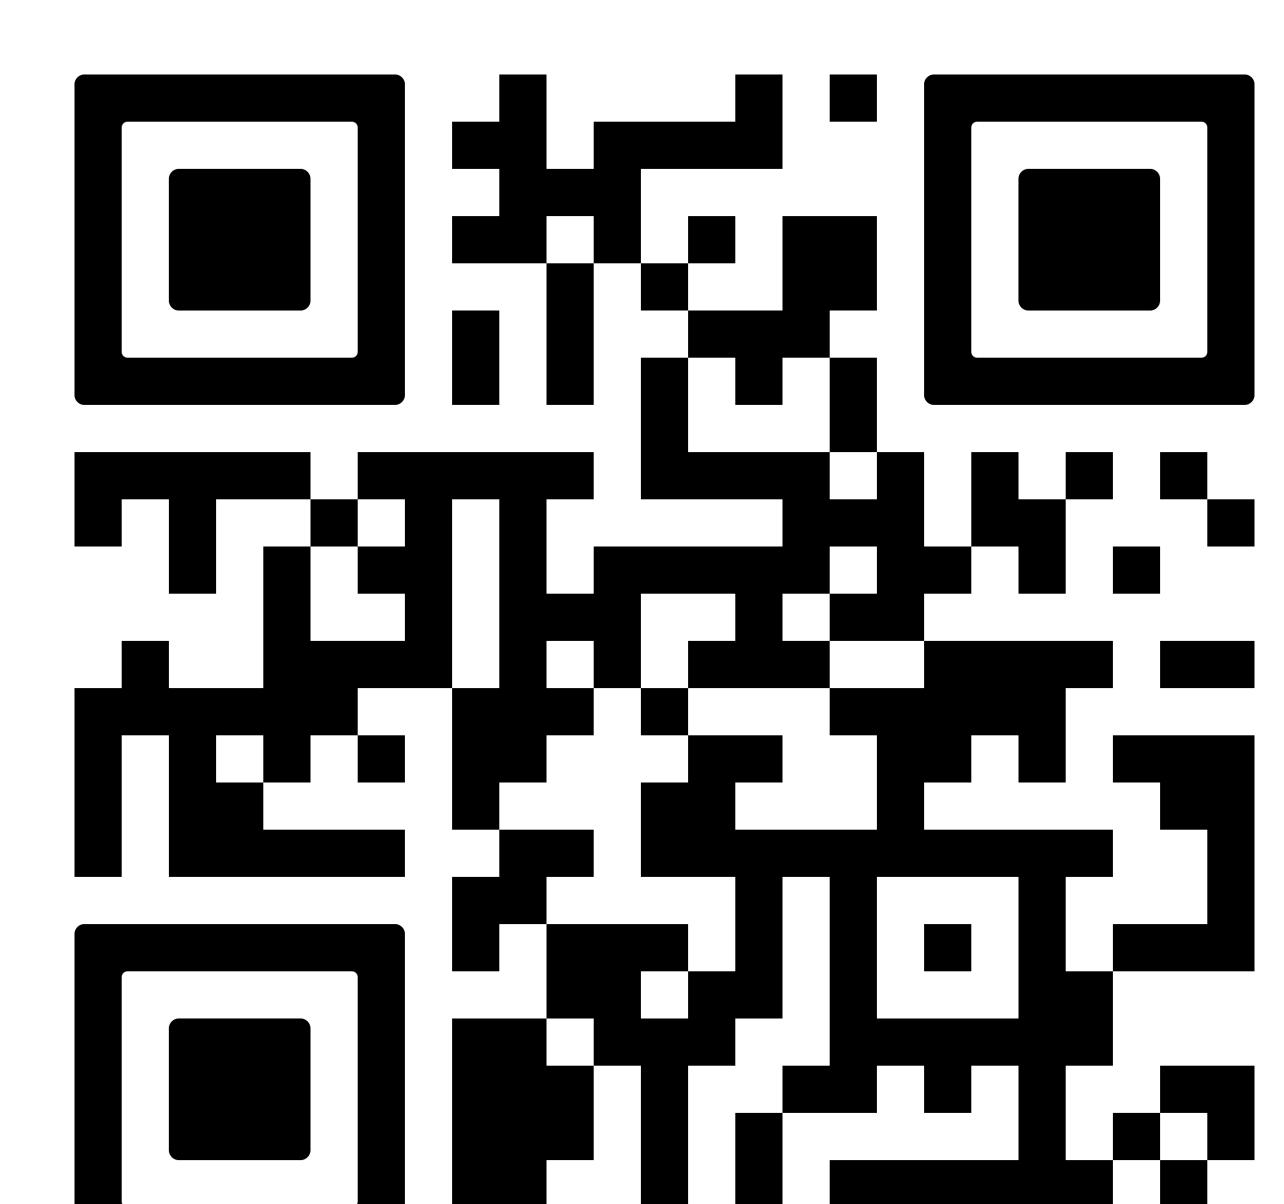

Temporal-specific models show improvements but still trail behind larger general-purpose models

## Future Work

- Extending to diverse structures beyond tables.
- Neuro-symbolic learning for interpretability.
